

Net Weight Bagging Systems

Typically there are 2 styles of bagging Systems. These include the Gross Bagging system and Net Bagging System. The Gross bagging system, in most circumstances is the most cost effective but the slowest and is designed to weigh the filling of product directly in to the product bag.

A Net Bagging system first fills the product into a weigh hopper then dumps the product into the bag once the appropriate weight is reached. The benefit of the Net Weighing system is when there is not a bag in place, the system is prepping the next dump and a Gross Weigher is only working when there is a bag in place

Net Weigh Bagging Systems come in a large range of styles. Below is typical Basic 20kg Net Weigh Bagging System. Typically this is 50+% faster than a Gross Weighing System dependant on the fill process

This system is designed and manufactured in Associated Scales Heathwood Factory, Brisbane
